Own the weights, not the runtime

Three small, task-specific local models for dbt on BigQuery, Composer DAGs and Cloud Run jobs, trained on the founder's machine and run inside Headworks. Decided 2026-11-02.

Owned: data, evals, weights (survive base-model changes) · Rented: base model, framework, teacher, runtime · Checks decide; models only draft

A new best sub-10B base every 6–13 months: regenerate the models from the data; do not start over. Budget per run: single-digit dollars of GPU time, or none on the M2 Max.

Issues: enrichmeai/penstock (model per request · JSON schema output · validator tools · MCP tools · release assets) and enrichmeai/culvert #285 #286 #287.
